

Detailed Installation & Run Instructions:

Installing Unity

- Download Unity from this site: <https://store.unity.com>
- Pick the most recent version (Free version)
- Follow the instructions on how to download and install, be aware that it requires a good deal of space to install

Creating the exe

- Take the given folder that contains all Unity Source Code and unzip it
- Open a new instance of the Unity Editor
- Use the “Open” option, and navigate to the source code
- This will load up the project
- Go to File->Build Settings -> PC, Mac & Linux Standalone, and click build.
- Accept all text boxes
- An exe should be generated at the location you specified while building.
- You can then simulate the client/server connection by having one instance of the project open in editor, and the other open from the exe.
